WHY I BUILT MABASA

Why check so many *websites to find a job?*

That question is why I built Mabasa.

THE SAME SEARCH, AGAIN

A financial analyst role. *In New York.*

Say that’s the job you want. You check a company’s Workday careers page, then repeat the search on other job sites.

FOR EXAMPLE, YOU CHECK

Workday **LinkedIn** **eFinancialCareers**

Different websites, separate searches. You’re still looking for the same kind of job.

01

THEN COMES THE RECORDKEEPING

You find a few jobs.

Now keep track.

You save some links. When you come back later, you still have to work out:

Where did I see that role?

Did I save the link?

Have I already applied?

THE REASON I BUILT IT

I wanted to bring *the search into one place.*

That’s the problem I wanted to tackle with Mabasa: listings from different sources, with a way to keep track of the jobs you find.

The aim: less time finding and organising listings, more time deciding where to apply.

03

HOW THAT WORKS

Find a role.

Check the original post.

Search by role and location. Browse the listings together, then open a job that interests you.

SEARCH	**Enter the role and location**
CHECK	**Read the original job posting**
APPLY	**Follow the employer’s instructions**

The original posting has the requirements and application details.

04

SOMEWHERE TO COME BACK TO

Keep track of *the jobs you find.*

Save interesting jobs and track your applications, so you can pick up where you left off.

SAVED JOBS	**Return to roles you want to review**
APPLICATIONS	**Keep a record of your progress**

Less searching for a lost link. More attention on the application you want to prepare.

05

IF YOU'RE JOB HUNTING

Which job websites *do you check most often?*

I'd like to hear where your search usually starts.
